

Appendix: Exemplar Project Summary I

Table 1: Three representative workspaces under `projects/templates/` illustrating heterogeneous domains while sharing Layer 1. This is a hand-picked sample, not the full roster: the complete public exemplar set (currently nine workspaces) is enumerated dynamically from `PUBLIC_PROJECT_NAMES` and listed below.

The full public exemplar roster is: `templates/template_active_inference`, `templates/template_autoresearch_project`, `templates/template_autoscientists`, `templates/template_code_project`, `templates/template_madlib`, `templates/template_newspaper`, `templates/template_prose_project`, `templates/template_sia`, `templates/template_template`, `templates/template_textbook`. The three rows below are a representative sample; a future `exemplar_summary_table` token in `build_manuscript_metrics_dict` would let this table cover every exemplar without hand-editing.

Appendix: Exemplar Project Summary II

Project slug	Purpose	Highlights	Tests	Figures (Stage 02 hint)
template_code_project	Optimization tutorial	Convex demo figures, scripted tables	197 @ 90%+ gate	Controlled matplotlib exports
template_prose_project	Prose-heavy workflow	Validates narrative-only repos	78	Lightweight / optional plots
template_autoresearch_project	AutoResearch readiness	Planner + validation CLI	157	Readiness reports from Stage 02

Appendix: Exemplar Project Summary III

Meta manuscript location: introspective study lives in `projects/`
`templates/template_template/` beside the public exemplar
set. Discovery now follows the typed `projects/` layout—`projects/`
`templates/**` and `projects/active/**` are
discovered/rendered, while `projects/working/**`, `projects/pu`
`blished/**`, `projects/archive/**`, and `projects/other/**`
remain non-rendered—see root `CLAUDE.md` for invocation patterns
(`resolve_project_root`).
